Discovery of Live Host using ARP, ICMP, FTP, UDP

Aim:

To discovery live host in a network using nmap and scans such as ARP, ICMP, TCP and UDP on tryhackme platform.

Objective:

To understand how nmap identifies active systems before performing further network scanning.

Software:

Nmap

Tryhackme nmap lab.

Computer with network success.

THEORY:

Nmap is a free and open source tool used to discover live host and nmap uses different live host using diffent protocols.

1) ARP scan - uses ARP scans request to find host on subract.

2) ICMP scan - use ICMP request and replies for identifies active host.

3) TCP scan - use TCP request and packets to specific ports and check response.

4) UDP scan and UDP packets + can identify on active host known ICMP port.

Observation:

. ARP request can discover host within same subnet.

ARP can connect cross routers because it
